THOUGHT PROCESS - FILE

Action: User wants defaults. I'll proceed with:

- Warm coffee-themed design (browns, creams, cozy)

- JWT-based email/password auth

- All basic features: registration, login, product browsing, ordering, payment (mock), invoice generation, order history

- Basic level implementation

Following workflow:

1. ✅ Clarified requirements (user chose defaults)

2. Call design agent for UI/UX guidelines

3. Explore current template structure

4. Plan implementation based on ASP.NET project requirements

5. Implement backend (FastAPI + MongoDB) and frontend (React) in bulk

6. Test with testing agent

7. Finish

The uploaded project shows:

- 5 models: Customer, Product, Order, OrderItem, Bill

- 5 controllers: Account, Product, Order, Bill, Home

- Features: Registration, Login, Product catalog, Order management, Payment, Invoicing

- Sample data: 12 products (coffee, tea, pastries), 3 users

I'll convert this SQL Server/ASP.NET MVC architecture to MongoDB/FastAPI/React stack.

Observation: Your thought has been logged.

Design Agent messages

Viewed

Action: **original_problem_statement**: use the project file and build the coffee shop management system website end to end with basic level.

user_choices: No explicit design preferences provided by user.

key_functionalities: User Registration, User Login, Product Catalog (browse coffee/tea/pastries), Search & Filter Products, Order Placement, Order History, Payment Processing, Invoice Generation, Profile Management

app_type: hybrid_fullstack

Observation: ## Design Phase Complete

- Successfully created a comprehensive design strategy for the Coffee Shop Management System.

- Selected Archetype 1 (Organic & Earthy) with a light theme, focusing on warm tones, terracotta accents, and elegant typography (Cormorant Garamond + Manrope).

- Sourced high-quality photography and generated custom hero and abstract background images.

- Created `design_guidelines.json` at `/app/design_guidelines.json` with detailed styling, spacing, typography, colors, media assets, and instructions for the main agent.

- Next Action Items: Proceed with implementing the frontend components and page layouts according to `/app/design_guidelines.json`.
